

MEMORANDUM

BioVerify — how to test it and what you need

To GENFIN Medical Aid Fund — Management
From Dr Washington Kapapiro, Jonomi Digital

Re Testing the BioVerify biometric identity system on the live demo

BioVerify is GENFIN's answer to card sharing and impersonation fraud: before medication is dispensed or a claim is honoured, the person at the counter proves they are the enrolled member — by face or fingerprint — not just by holding a card. This memo explains what you can test today on the live demo, which devices to use, and what the production rollout adds.

1. What is live in the demo vs. production

Capability	In this demo	In production
Face capture	Real — uses your device camera in the browser	Face engine with liveness detection
Fingerprint capture	Simulated (button press) — no scanner needed to test the flow	Neurotechnology VeriFinger SDK with certified USB fingerprint scanners
Enrolment workflow	Full 4-step wizard, consent statement, coverage statistics	Same, tied to the live member database with encrypted template storage in Zimbabwe
Verification terminal	Camera-based verification screen for pharmacy counters	Face or fingerprint match against encrypted templates, logged to the audit trail
QR certificate check	Real — scan the QR on any membership certificate	Same, with signed tokens

2. Devices you can use to test

No special hardware is needed for the demo. Use any of the following — the requirements are simply a camera, an up-to-date browser (Chrome, Edge or Safari) and an internet connection. The site runs on HTTPS, which is what allows the browser to use the camera.

Device	How it works for testing
Laptop or desktop with webcam	Best for the enrolment wizard — the large screen shows the full staff workflow
Smartphone (iPhone or Android)	Best for the verification terminal — the front camera acts as the counter camera; also use it to scan certificate QR codes
Tablet (iPad or Android)	Closest to a real branch counter terminal setup

When the browser asks "Allow camera access?", choose **Allow**. Nothing is uploaded in the demo — the capture stays on your device.

3. Test 1 — Enrol a member (staff side, 3 minutes)

#	Step
1	On a laptop, open genfin-platform.vercel.app/bioverify-enrol
2	Review the coverage dashboard: 60,821 lives, progress toward the 100% enrolment goal, and the "Awaiting enrolment" queue
3	In "New enrolment", pick a person from the queue, note the consent statement, press "Continue to fingerprint"
4	Press "Simulate finger scan" twice (two index fingers) — in production this is a real scanner touch — then "Continue to face"
5	Press "Start face capture" and allow camera access; look at the camera and hold still
6	Review the confirmation: both modalities captured, enrolment ID issued. Press "Enrol next person" to repeat

4. Test 2 — Verify a member at the counter (pharmacy side, 1 minute)

#	Step
1	On a phone or laptop, open genfin-platform.vercel.app/biometric/verify.html
2	Allow camera access — this screen is what a pharmacist sees before dispensing
3	Follow the on-screen capture; the terminal simulates the match decision against the enrolled template
4	Also open genfin-platform.vercel.app/bioverify-facial (the "BioVerify" item in the staff sidebar) for the facial terminal walkthrough

5. Test 3 — QR certificate verification (30 seconds)

#	Step
1	Sign in as the demo member (member@genfin.demo / demo2026) and open "Membership certificate"
2	Point a second phone's camera at the QR code printed on the certificate
3	The phone opens the GENFIN verification page showing the certificate status with the member number and benefit year

6. Production hardware (next phase)

For live branch and pharmacy deployment, each verification counter needs one USB fingerprint scanner supported by the Neurotechnology VeriFinger SDK. Proven options in this class include the SecuGen Hamster Pro 20, DigitalPersona U.are.U 4500 and Futronic FS88H — typically in the US\$60–120 range per unit. Face verification needs only the standard webcam or tablet camera already at the counter. Biometric templates are encrypted, stored in Zimbabwe in line with the data-residency policy, and every verification is written to the audit log. Consent is captured at enrolment, as you will see in Test 1.

7. What to look for when evaluating

Judge the workflow, not the matcher: is enrolment fast enough for a branch queue, is the consent step clear, would a pharmacist understand the verify screen without training, and does the coverage dashboard give management the right picture of the 100% enrolment drive? The matching engine itself is the certified VeriFinger engine at production — the screens and workflow you are testing are what your staff and members will actually use.

We look forward to your feedback.
